1 INTRODUCTION

This document describes the communication between the LoRa device (node) and the network server/cloud and how to interpret the data packets.

Communication can take place in both directions. Sending measured data from the device to the network server (uplink), and send configuration changes from the network server to the (downlink) device.

2 FRAME FORMAT (GENERAL STRUCTURE)

This describes the general structure of a LoRa data package.

2.1 Network server information

2.1.1 Device identification EUI

The DevEUI (Unique Identifier), which is determined with each transmission, is used to uniquely identify the devices. This EUI cannot be changed and I preconfigured on the device.

2.1.2 Time information

The Time information is transferred with the payload when the message is sent, or the message is time-stamped. This time can therefore be used as the measurement time. The time information will also be transmitted in the status information.

2.1.3 Transmission counter (Frame Up / Down)

The transmission counter is incremented on both sides for each message sent or received. Thus it can be determined how many transmissions have worked and how many have not.

2.1.4 Confirmed and unconfirmed transmissions ("Cnf"/"UnCnf")

A confirmed or unconfirmed transmission has no influence on the content of the message, the advantage of a confirmed transmission is that the sender recognizes whether the message has been transmitted or received.

The disadvantage is that the energy consumption is slightly higher, since the receipt of the confirmation consumes additional energy. In addition, with each confirmed transmission, the network server confirms receipt of the packet, which results in a downlink. Since the downlink should be limited to a minimum, this can lead to additional costs depending on the network server.

For these reasons we recommend unconfirmed transmissions. The basic configuration of the KELLER devices is "UnCnf" transmissions.

Version 02/2020 Seite 3 von 21

2.2 Data bytes / Payload encode and decode

Depending on the data type selected, the data is assigned to a specific port. The user data content is the payload.

This is an example from TTN (The Things Network)

Both port and payload are available in both directions (uplink and downlink).

2.2.1 Port

Depending on the data type selected, the data is assigned to a specific port. Thus the data type can be distinguished without interpretation of the payload.

Port	Meaning
1	Measurements
2	Alarm
3	Configuration
4	Info (Battery voltage, Humidity, Time)
5	Answer on a request

2.2.2 Payload

The payload contains the user data. The size of the payload or the number of bytes transferred varies depending on the information or command. The maximum amount of data in one message is limited to 51 bytes.

The data bytes are transmitted in "ASCII" / "Hexadecimal" format. Groups of 2 "ASCII" characters form a byte in the data format Byte. This means that the payload (user content) is, for example, interpreted as follows:

Payload = 00AAF023 are 4 bytes that were transmitted.

- Byte 0: 0x00 = 0 - Byte 1: 0xAA = 170 - Byte 2: 0x00 = 0 - Byte 3: 0x23 = 35

Which information the transferred payload contains can be seen from the first data byte the "function code".

Byte – N°		1	2		51
Meaning		Functions-code	user data	user data	user data
	Function code	Type of data			
	1 (0x01)	"Measurement" message			
	12 (0x0C)	"Info" message			
	31 (0x1F)	1 Byte variable			
	32 (0x20)	1 Byte variable (Stream)			
	51 (0x33)	4 Byte variable			
	52 (0x34)	4 Byte variable (Stream)			
	61 (0x3D)	Float variable			
	62 (0x3E)	Float variable (Stream)			
	71 (0x47)	ASCII sign			
	72 (0x48)	ASCII sign (Stream)			
	81 (0x51)	KELLER pressure sensor information			

Version 02/2020 Seite 4 von 21

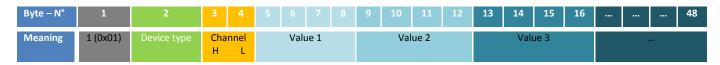

3 FUNCTION CODES

The interpretation of the different function codes is described in the following chapters of this document.

3.1 1 (0x01) Measured values in float format (4 Byte)

Different numbers of measured values can be transmitted. The number and which channels are transmitted can be seen from the two "Channel" byte and the selected "Connection type" (see table below). Due the limitation of the payload length to 51 Bytes it is only possible to send maximum 11 channels in one message. The other channels will be transmitted in a second message.

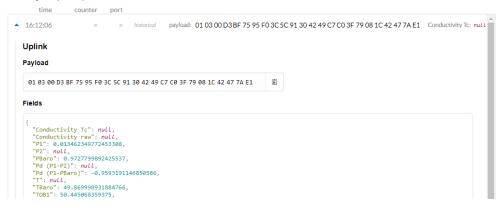

The "Device type" indicates the channel assignment. See "Device Type Overview".

The "Channel" shows you how many and which channels are transmitted in the message. Each bit stands for one channel, thus channel 1 ... 16 are selectable.

Bit Position	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Channel	CH 16	CH 15	CH 14	CH 13	CH 12	CH 11	CH 10	CH 9	CH 8	CH 7	CH 6	CH 5	CH 4	CH 3	CH 2	CH 1

Example: Channel: $0000'0000\ 1000'0101 = Values\ 1 + 3 + 7$ are contained in the message. The least significant bit of the channel is always the first value.

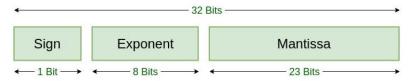

Example (TTN):

Payload:

010300D3BF7595F03C5C91304249C7C03F79081C42477AE1

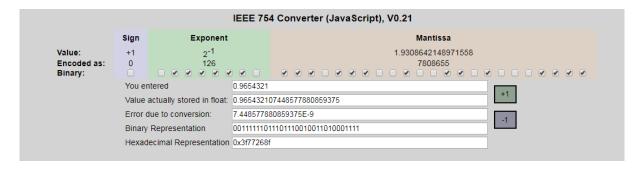

The **"Value"** of the corresponding channels follows each other and each consists of 4 bytes and is in float IEE 754 format.

Single Precision
IEEE 754 Floating-Point Standard

Version 02/2020 Seite 5 von 21

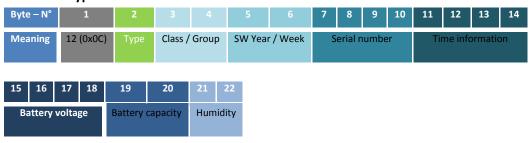

Version 02/2020 Seite 6 von 21

3.2 12 (0x0C) "Info" message

The "Info" message contains useful data of the device itself and actual status information of it.

3.2.1 Type 1

The "type" is reserved for future use. Now it is always 1.

The "Class / Group" is represented by two hex values, where the first two chars are representing the class and the second two chars are representing the group.

The "SW Year / Week" is represented by two hex values, where the first two chars are representing the year and the second two chars are representing the week.

The "Serial number" is represented by four hex values.

The "Time information" represents the time in seconds from 1.1.2000 .Note that this time is a local time not UTC.

The "Battery voltage" is represented by four hex values, which consist of 4 bytes and are in float IEE 754 format.

The "Battery capacity" is represented by 1 byte.

The "Humidity" is represented by 1 byte.

Example (TTN):

Payload:

0C01093213320000009B25AB2BA94078F7316315

Class.Group (Device Information): 09.50 (Class: 0x09 is 9, Group: 0x32 is 50) SW-Version (Year.Week): 19.50 (Year: 0x13 is 19, Week: 0x32 is 50)

Serial number: 155 (0x0000009B)

Time information (Device time): 2020-01-10 12:33:45 (in seconds after the year 1.1.2000 0:0:0

0x25AB2BA9 -> 631974825

Battery voltage: 3.8901 V (0x4078F731)

Battery capacity (calculated): 99 % (0x63) Humidity: 21 % rel (0x15)

Version 02/2020 Seite 7 von 21

3.3 31 (0x1F) 1 Byte variable

Different numbers of 1 byte values can be transmitted. There are always 2 byte packets, where the first byte is the index number "Index" and the second byte is the value "Val"

Index: Index number

Val: Value of the corresponding index

3.4 32 (0x20) 1 Byte variable - stream

A larger number of 1 byte values can be transmitted, whereby only the Index number "Index" of the first byte is specified, the following bytes are variable contents added in ascending order without gaps.

Byte – N°	1	2	3	4	5	6	7	 51
Meaning	32 (0x20)	Index	Val _{Index}	 				
		(n)	(n)	(n+1)	(n+2)	(n+3)	(n+4)	

Index: Index number (after each Byte increase index value by 1)

Val: Value of the corresponding index

Example (TTN):

Payload:

2001093213320D010303000100D30004000263010201FF01

Version 02/2020 Seite 13 von 21

3.9 71 (0x47) ASCII characters

Different numbers of ASCII characters can be transmitted. The length of the packets can vary depending on the ASCII characters, where the first byte is the start index number of the ASCII array and the second byte the index number "Index" which defines the chosen ASCII values followed by the ASCII content. The end is signalled with OXFF.

Note: it is always taken care that the entire ASCII array fits into the payload, if not a new message is issued

Byte – N°	1	2	3	4		•••	n	n+1	n+2	n+3			n+z
Meani	71	start	Index		ASCII		0xFF	start	Index	ASC	II charac	ters	0xFF
ng	(0x47)	index	(x)	ch	aracte	ers		index	(y)		(x)		
		ASCII			(x)			ASCII					
		Array						Array					

Array Index: start index number of the ASCII array ()

Index: Index number

ASCII characters: Float value of the corresponding index

3.10 72 (0x48) ASCII characters - stream

With function 72 the ASCII values are sent in a continuous stream. The index only appears at the beginning and is then automatically increased after an end character.

Note: it is always taken care that the entire ASCII array fits into the payload, if not a new message is issued

Array Index: start index number of the ASCII array ()

Index: Index number

ASCII characters: Float value of the corresponding index

Example (TTN):

3.10.1 Definition of variable function 71/72 (data type: ASCII characters)

Index	Description	Example / Range	adjustable	Firmware Version
1	Firmware Version (short)	31 2E 30 2E 30 32 FF -> 1.0.02	Ø	19.50
2	Device EUI	30 30 39 44 36 42 30 30 30 30 43 35 44 33 38 32 FF -> 009D6B0000C5D382 Note: 16 ASCII characters	Ø	19.50
3	Application EUI*	37 30 42 33 44 35 37 45 44 30 30 32 34 36 41 34 FF -> 70B3D57ED00246A4 Note: 16 ASCII characters	✓	19.50
4	Application Key*	33 31 43 34 39 34 43 37 44 46 44 38 37 46 30 33 33 35 35 46 44 45 30 41 37 31 45 38 42 35 37 32 FF -> 31C494C7DFD87F03355FDE0A71E8B572 Note: 32 ASCII characters	√	19.50
5	Device Address*	32 36 30 31 32 31 43 36 FF -> 260121C6 Note: 8 ASCII characters	√	19.50
6	Network Session Key*	32 46 41 38 30 32 43 32 43 39 44 35 46 46 41 41 46 35 35 44 45 35 35 38 34 30 34 45 36 36 32 30 FF -> 2FA802C2C9D5FFAAF55DE558404E6620 Note: 32 ASCII characters	√	19.50
7	App Session Key*	30 46 36 39 32 46 45 31 43 45 44 46 37 37 42 46 32 38 38 37 33 39 44 39 36 45 44 45 35 34 41 37 FF -> 0F692FE1CEDF77BF288739D96EDE54A7	√	19.50

^{*} This values will not be changed until the user sends the confirmation (function 90 / Index 11 (Accept the configuration)).

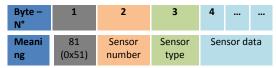

Note: If an Index has no characters (empty) than only 0xFF will be appended

Version 02/2020 Seite 15 von 21

3.11 81 (0x51) KELLER Sensor information

With function 81 the information of the KELLER pressure sensor can be extracted. The content varies depending on the variant of the sensor (RS485 or I²C (not available)).

Sensor number: Sensor count

Sensor type: Sensor type $(0 = Unknown / 1 = RS485 / 2 = I^2C (not available)).)$

ASCII characters: Float value of the corresponding index

Example (TTN):

time	counter	port	
15:29:43	1470	5	payload: 51 01 01 05 14 0C 1C 00 0C EB A1
4			
▼ 15:29:35		3	payload: 5A 0A 00 00

Payload:

51010105140C1C000CEBA1

3.11.1 Sensor type 1 / RS485

Description	Example / Range	Туре	Firmware Version
Sensor Class	0x05 = 5	unsigned char	19.50
Sensor Group	0x14 = 20	unsigned char	19.50
SW Version Year	0x0C = 12	unsigned char	19.50
SW Version Week	0x1C = 28	unsigned char	19.50
Serial number	0x000CEBA1 = 846753	unsigned long	19.50

3.11.2 Sensor type 2 / I²C (not available)

Description	Example / Range	Туре	Firmware Version
Unique ID	0x04070144	unsigned long	19.50
Scaling 0	0x1574 200b00010 1010 11101 2 10 29 0 => Date: 29.10.2012, Mode: PR	unsigned int	19.50
Pmin Val	0x00000000 = 0 bar	unsigned long	19.50
Pmax Val	0x41F00000 = 30 bar	unsigned long	19.50

Version 02/2020 Seite 16 von 21

3.12 90 (0x5A) Command / Configuration

The user has the possibility to query different parameters using the function 90. Only one command can be transmitted. As parameter (Para) a maximum of 2 bytes can be transferred with the command. Start value must be less than or equal to Stop value.

Byte – N°	1	2	2	3
Meaning	90 (0x5A)	Index	Para 1 (unsigned char)	Para 2 (unsigned char)

Index: define the function to be used

Para 1: defines the start index of the response message of the selected function Para 2: defines the stop index of the response message of the selected function

Note: Para 1 and Para 2 correspond to the Index of the corresponding function (see function table). Is Para 1 and Para 2 equal to 0, then all variables are transferred.

Note: Only downlinks with port number 3 will be accepted. The response to a request is sent to port 5

Example (TTN):

time	counter	port	
1 5:29:43	1470	5	payload: 51 01 01 05 14 0C 1C 00 0C EB A1
4			
▼ 15:29:35		3	payload: 5A 0A 00 00

3.12.1 Definition of commando function 90 (data type: unsigned char)

Index	Description	Para 1	Para 2	Firmware Version
1	Request measured values	0	0	18.12
2	Request small configuration	0	0	18.12
3	Request 1 Byte stream (Function code 32)	1	22	18.12
4	Reservec			
5	Request 4 Byte stream (Function code 52)	1	12	18.12
6	Request Float stream (Function code 62)	1	26	18.12
7	Request "Info" message (Function code 12)	0	0	19.50
8	Request big configuration	0	0	19.50
9	Request ASCII stream (Function code 72)	1	7	19.50
10	Request KELLER Sensor information (Function code 81)	1	5	19.50
11*	Accepting the configuration	0	0	19.50

^{*} This Index is only needed to reconfigure the LoRa Keys and Settings. Here you have to know exactly what you're doing.
